Abstract

In the following report Drs. Buttram and Yazbak have reviewed the case of an infant death which they believe to have been mistakenly diagnosed as shaken baby syndrome, the true cause of death in their opinions having been a vaccine-induced encephalitis. Having carefully followed the case and its developments for nearly a year, the report represents untold numbers of hours of study and investigation into the many technical parameters of the case. From this study they have come to realize that this case is representative of an emerging pattern of increasingly frequent vaccine reactions on the modern scene, which are being overlooked or misdiagnosed by our present health-care system.

The *Story of Baby Alan* is a poignant one, all the more so because it is something that could happen to any young couple or parent. Although the story is necessarily technical, nevertheless the authors urge that you read it. If you are a young person contemplating having a family, it is something that could happen to you.
